

- The animation effect should be loaded into the page at startup instead of slowly appearing from top left corner
- When I hover over a nav bar button like about or experience, it should become white. All are grey now and even while hovering over them they are still grey
- In the experience section, only the company name, logo, my role, dates and location should be present. And when I select any entry, the notable projects at that company and for that role should be displayed with the pill tags. and when I click on view details for any project, then the current view details pop up for that project should appear. The latest experience entry should be selected by default.

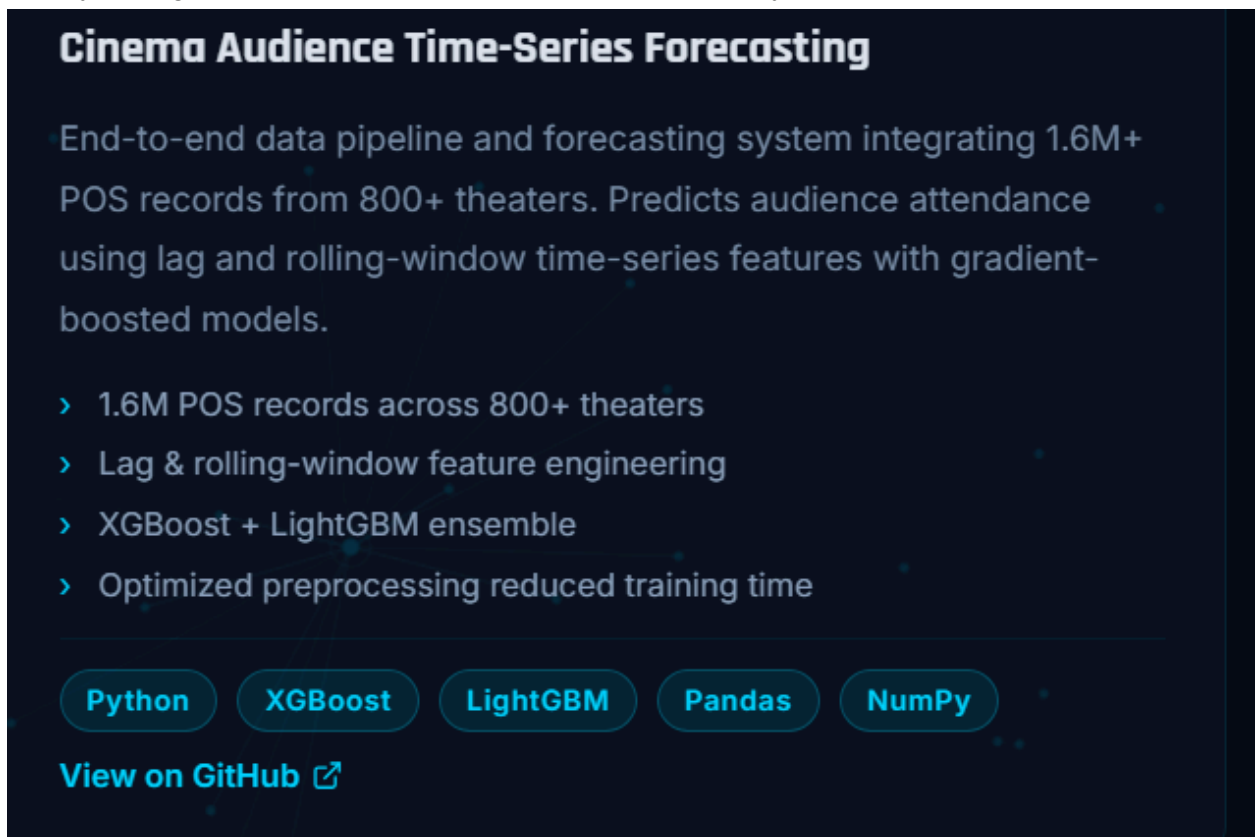

Take this as reference: (same except an added company logo in the experience section.)

- Also right now, when I click on view details, the top part is cut off. So fix that as well:

- In the projects section, everything is fine except for how the USPs for each project is displayed. Right now it looks like this (marked with the “>” symbol)

But it should look like this: (with a unique symbol for each USP):

Car Hail Damage Repair

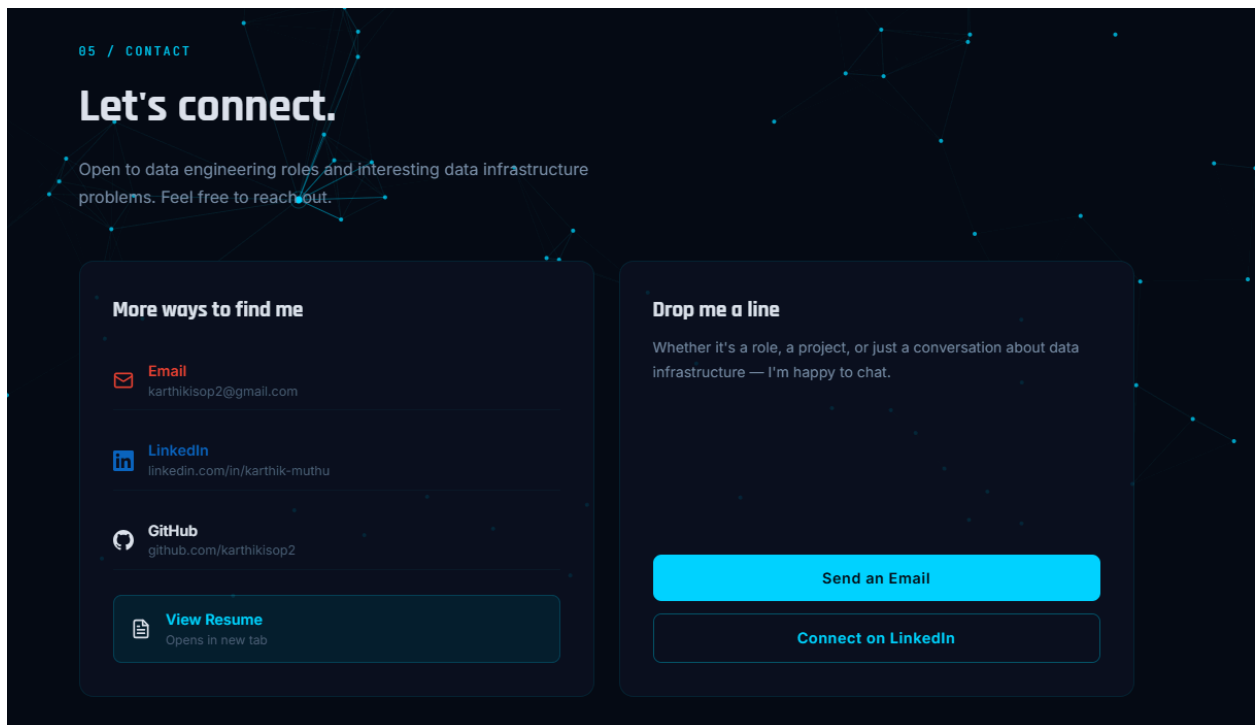

A comprehensive solution that streamlines vehicle damage assessment using AI technology. This innovative system allows users to upload images of damaged vehicles and receive instant analysis of damage severity and repair options through a portable device.

-  User-Friendly Web App with Flask
-  Smart Image Processing with OpenCV and Pillow
-  Machine Learning Analysis powered by TensorFlow
-  Efficient Data Processing with NumPy

PythonFlaskTensorFlowOpenCVNumPy

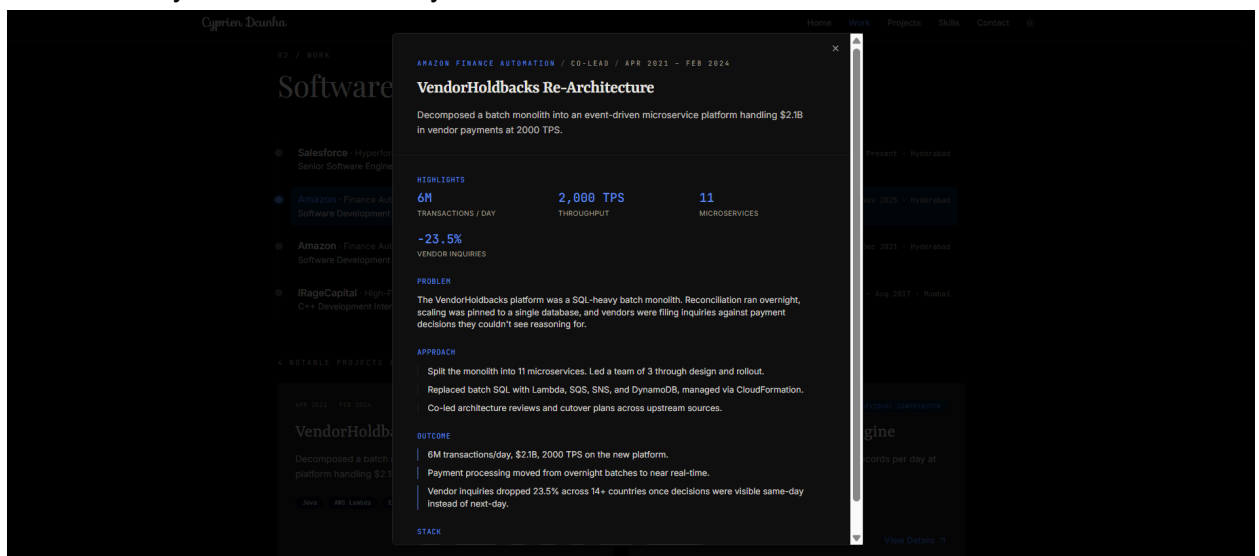

- In contact, remove the drop me a line box as it is repetitive and center align the more way to find me:

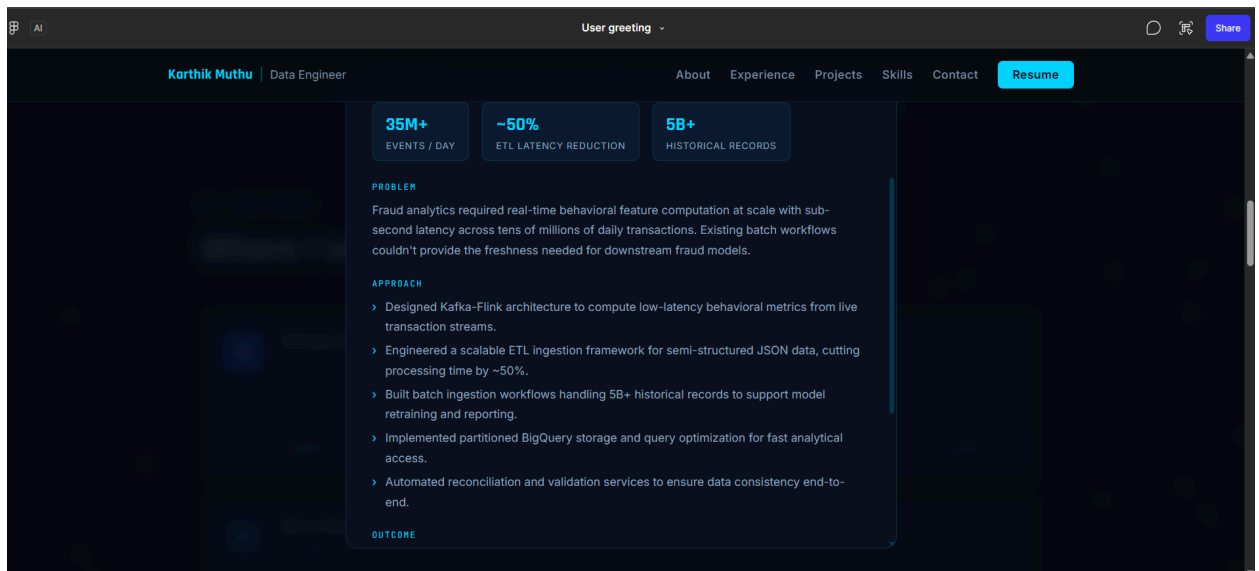

- Remove the numbers that you have for each section (the number and the /):

- Add another project
- While in the “view details” view of experience section, make it so that when a person has their mouse outside of the “view details” view, and they scroll, it shouldn't scroll, but when their mouse is inside the view and they scroll, it should. Basically disable the scroll bar when they enter this view as you can see here:

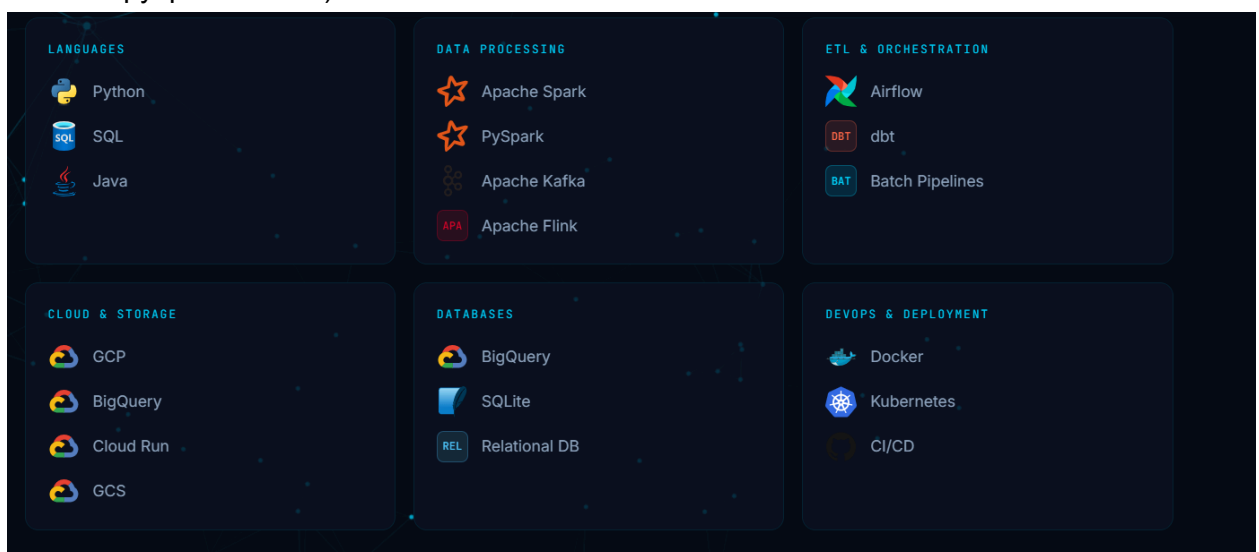

But here, it is still there:

They shouldn't be able to click on nav bar buttons either until they exit the view.

- Each skill should have a different icon (all of the cloud skills are repeating and apache sark and pyspark as well):

- let there be a download button on top that downloads whole design in a pdf. all the major components and overlays in a structured format if possible
